

Condensing Compressor Upgrade Kit

Keeping your BroadBeam machine in optimal working condition means keeping the high voltage deck cool. PCT's Condensing Compressor Upgrade Kit is the answer. The Kit replaces the original R12 Freon charged cooling unit with a more environmentally friendly system using R134a refrigerant. In addition the Kit has been designed to provide increased cooling capacity.

Replacing the Freon system is necessary because replacement parts and service are no longer readily available. The new Condensing Compressor Kit includes all of the necessary components. Plus installation by a PCT service technician can be completed during a brief outage.

As part of the Kit, we offer a high-capacity blower to circulate the SF6 in the high voltage enclosure. The new blower improves air flow over the heat exchanger allowing it to better cool the high voltage deck. PCT service personnel say the additional cooling capacity is especially beneficial because temperatures can be controlled with less risk of overload to the system.

Replacement Parts Supplied

- compressor unit
- solenoid valve
- hot bypass valves
- expansion valves
- hoses
- SF6 blower
